                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a nucleic acid sensor molecule (I) comprising an enzymatic nucleic acid component and one or more sensor components. (I) is useful in diagnostic applications to identify the presence of genes and/or gene products indicative of a particular genotype and/or phenotype, e.g. a disease state or infection and for diagnosis of disease states or physiological abnormalities related to the expression of viral, bacterial or cellular RNA and DNA. (I) is useful in nucleic acid-based electronics, for the detection of specific target signalling molecules, in assays to assess the specificity, toxicity and effectiveness of various small molecules, nucleoside analogues or non-nucleic acid drugs or for detection of pathogens, biochemicals, organic or inorganic compounds. The present sequence is that of a DNAzyme motif of the
                                                                           WO200157206-A2
                                                                                                                                  Unidentified
                                                                                                                                                                                Human; checkpoint kinase-1; Chkl; antisense; RNA cleavage; cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC low-grade or follicular NHL, lymphocytic leuksemia, HIV (human) associated NHL, manthe-cell lymphoma (MCL), cc immunocytioma (IMC), small B-cell lymphocytic lymphoma, immune CC immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune CC immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune CC immunocytoma and inflammatory arthropathy. The NOGO-targetting CC involeic acid is used to cleave RNA of the NOGO gene in the presence of a CC divalent cation that is preferably Mg^2^+. Furthermore, the nucleic acid CC may be contacted with a cell to reduce NOGO activity of the cell and CC treat a patient having a condition associated with the level of NOGO. The CC treat apatient having a condition associated with the level of NOGO. The CC in particular, the NOGO-targetting nucleic acid may be used to treat CC central nervous system (CNS) injury and cerebrovascular accident (CVA, CC central nervous system (CNS) injury and cerebrovascular accident (CVA, CC central nervous disease, dementia, multiple sclerosis (MS), CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob CC disease, muscular dystrophy, and/or other neurodegenerative disease CC present sequence is a DNAzyme molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) and G-cleaver (cleaving RNA with a NYN motif) are an amborzyme (cleaving RNA with an NCH triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2^+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (MHL), bulky
Human; chloride channel calcium activated 1; CLCA1; ss; antiasthmatic; antiinflammatory; chronic obstructive pulmonary disease; COPD; asthma; chronic bronchitis; cystic fibrosis; obstructive bowel syndrome; oxygen therapy; bronchodilator; corticosteroid; vaccination; mucokinet acetylcysteine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention expression of

                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to enzymatic nucleic acid molecules that down CC regulate expression of chloride channel calcium activated 1 (CLCA1) genes CC by cleaving RNA derived from the genes. The nucleic acid sequences are CC useful as pharmaceutical agents for treating conditions such as chronic CC chirosis, obstructive bowel syndrome and any other diseases or conditions CC that are related to or will respond to the levels of CLCA1 in a cell or CC tissue. The sequences are useful for reducing CLCA1 activity in a cell, CC hence, are useful for treatment of a patient having a condition CC associated with the level of CLCA1, where the invention further comprises CC treatment, for example, oxygen therapy, bronchodilators, corticosteroids, CC antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The cultivacterials, vaccinations, acetylcysteine and mucokinetic agents tools to ceramine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an

(I) is useful for CC treating a patient having a condition associated with the level of ERG, CC by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies CC under conditions suitable for the treatment. Leukaemia or tumour CC angiogenesis is treated by administering (I) to the patient in CC conjunction with one or more of other therapies such as radiation or CC chemotherapy treatment. (I) is useful for reducing ERG activity in a CC cell, by contacting the cell with (I). (I) is useful for claving RNA of CC gene, by contacting (I) with RNA, in the presence of a divalent CC tation such as Mg2+. (I) is useful for diagnosis of conditions and CC cation such as Mg2+. (I) is useful for diagnosis of conditions and CC diseases related to the expression of ERG, and as diagnostic tool to CC examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically CC targeting genes that share homology with ERG gene or ERG fusion genes. CABK17354-ABK2719 represent nucleic acids, including antisense and CC enzymatic nucleic acid molecules which regulate expression of ERG, and CC related PCR primers of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (1) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg'2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A specific inhibitors or hear there are a second antibodies and a second antibodies antibodies antibodies antibodi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                    chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, restenosis, asthma, crohn's disease, diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Stinchcomb DT, Mcswiggen J,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic
rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents a motif of an enzymatic nucleic acid used to modulate the function of a necrosis factor kappa B sub-unit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fig 4; SEQ ID

                                                                                                                                                The present sequence is an example of a DNAzyme, an enzymatic conclear acid (ENA) that does not require the presence of a 2'-OH CC group for its activity. DNAzymes can be used as the ENA moiety in convel ENA peptide conjugates (I) of the invention that facilitate convel ENA peptide conjugates (I) of the invention that facilitate convel ENA peptide part of the conjugate is typically a fusogenic peptide such as a peptide given in ABP72395. The conjugates can be used to treat a cancer patient, where the cancer is breast, lung, colorectal, brain, oesophageal, stomach, bladder, pancreas, cervix, concert and neck or ovary cancer, melanoma, lymphoma, glioma or control of the virus is HIV, hepatitis B virus, herpes simplex virus, cytomegalovirus, Rous sarcoma virus, herpes simplex virus, Ebola covirus, foot and mouth disease virus, west nile virus (all colimed). (I) are useful for introducing nucleotides, proteins cond/or non-nucleosidic small molecules into a cell and to detect the presence of a target molecules into a cell and to detect consense, cell or cell lysate. They are useful as diagnostic tools consense, cell or cell lysate. They are useful as diagnostic tools consense, cell or cell diff and mutations within diseased cells or to detect the presence of a disease-related RNA in a cell.

The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HERZ, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ66583 - ABZ65532 - ABZ65519, ABZ65539, ABZ65529, ABZ66529, ABZ66528 represent human ribozymes of

                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ6658 represent human ribozymes of terminates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                29-MAY-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for determining whether a cc subject is afflicted with a disorder characterised by the presence of cc sknown nucleic acid. The method comprises: (i) amplifying, in an cc isolated sample from the subject, the nucleic acid segment that, in an cc affected individual contains (A), (ii) treating the amplicons with a cc catalytic nucleic acid (1) that specifically recognizes and cleaves a cc target sequence present in either the mutated or wild-type segments, but not in both; and (iii) detecting any cleavage caused by (I). Step cc (ii) may be performed concurrently with (i). The method is specifically used to diagnose cancer (especially), acquired immune deficiency crestriction fragment length polymorphism (RFLP) analysis); such sites occur more frequently than restriction enzyme sites, and mismatched primers can be used to induce cleavage sites for (I). The method is perfocially contrainly more firetable than RFLP and does not require my enzymes or toxic compounds. AAZ34339 to AAZ34450 represent oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                subject is afflicted with a disorder characterised by the presence of CC a known nucleic acid. The method comprises: (i) amplifying, in an CC catcalytic nucleic acid. The method comprises: (i) amplifying, in an CC catcalytic nucleic acid (I) that specifically recognizes and cleaves a CC catcalytic nucleic acid (I) that specifically recognizes and cleaves a CC target sequence present in either the mutated or wild-type segments, but not in both; and (iii) detecting any cleavage caused by (I). Step (ii) may be performed concurrently with (i). The method is specifically used to diagnose cancer (especially), acquired immune deficiency used to diagnose cancer (especially), acquired immune deficiency syndrome and cystic fibrosis. (I) recognises as few as two by to create a cleavage site (contrast at least 4 by required by enzymes used in restriction fragment length polymorphism (RFLP) analysis); such sites occur more frequently than restriction enzyme sites, and mismatched potentially more flaxible than RFLP and does not require any enzymes or toxic compounds. AAZ34339 to AAZ34450 represent oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method for the amplification and CC quantitative real-time determination of nucleic acid (I) using a primer CC attached to a 1-40 nucleotide sequence (II) in the transcription product. CC Amplification is done in the presence of an excess, preferably 50-500 nM, CC of a nucleic acid probe (III) and labeled by a reporter molecule and a CC quencher molecule. (I) encodes the motif 5-GAAA-3' (A), and (II) CC contains the motif 5-CUGANGA-3' (B). (III) has 25-60, especially 50, contains the motif 5-CUGANGA-3' (B). (III) has 25-60, especially 50, cc nucleotides. The method is used to detect and quantify (I) from CC quantification of (I), particularly RNA by NASBA (RTM) (nucleic acid contains the motif of (I), particularly RNA by NASBA (RTM) (nucleic acid contains the probes (see Nucleic Acid Res., 26 (1998) 2150) and is suitable contained to the combination of (A) and (B) generates a contained that cleaves the probe and generates a fluorescent contained that cleaves the probe and generates a fluorescent contained to the combination of (A) and (B) generates a contained to the probe account times. The method is very specific since exact hybridization of probe to target is necessary for cleavage to occur. Complicated probes are not required because cleavage results in dissociation of the probe from the target (which consisting mainly of 2'-deoxyribonucleotides.

acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABEG6217 - ABEG6434, ABEG5532 - ABEG5519, ABEG6525 - ABEG6529, ABEG6586 - ABEG6568 represent human ribozymes of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS.                                              The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ65433, ABZ65532 - ABZ65519, and ABZ65519.
                                                                                                                                                                                                                 Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ662217 - ABZ66533 - ABZ65532 - ABZ66529, ABZ66528 - ABZ66529, ABZ66529, ABZ66528 - ABZ66529, ABZ66529, ABZ66529 represent human ribozymes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ64543, ABZ65532 - ABZ65519, ABZ66529, ABZ66529, ABZ66586 - ABZ66588 represent human ribozymes of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-R human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and acid molecule of the invention has cytostatic, anti-HIV, and acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ64543, ABZ65532 - ABZ66529, ABZ66529, ABZ66586 - ABZ66658 represent human ribozymes of ABZ66525 - ABZ66529, ABZ66586 - ABZ66658 represent human ribozymes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2003-140484/13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mcswiggen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-F human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, acids are also useful for treating breast, ovarian, colorectal, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ66534, ABZ65532 - ABZ665519, ABZ66525 - ABZ66529, ABZ66526 - ABZ66586 - ABZ66588 represent human ribozymes of invertice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel

Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences

WPI; 2003-140484/13

acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-K human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and

The invention relates to a novel short

interfering

RNA (siRNA) nucleic e, that modulates

N-Ras

The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, overrian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ66543, ABZ65532 - ABZ65519, ABZ66525 - ABZ66529, ABZ66526 - ABZ66528 represent human ribozymes of
                                                                               The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein mRN which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' of the catalytic domain. Lack of expression of the hairless gene due of the catalytic domain. Lack of expression of the hairless gene due
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 29
                                                                                                                                                                                                                                                                                                                               New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hair loss; atrichia; hair growth; hirsutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production;
                               inherited mutations leads to the complete loss of hair, known atrichia. Abundant hair growth, hirsutism, can be improved by

Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the
                                                           New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal product;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          25-FEB-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have

Hairless Protein

mRNA

```
CC consensus sequence and binding domains contiguous with the 5 and 3 ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as cCC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC atrichia. Abundant hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have CC a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonuclectides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids CC are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting CC the transition of a hair follicle from the anagen phase to the catagen catalyce of the sequence presented is useful as a model for testing CC hase. A non-human transgenic mammal is useful as a model for testing the catalyce of the sequence presented is the deoxy-ribozyme that cleaves the composition hairless protein man hairless protein man a timediately after myllocides that cleaves the

CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC of the catalytic domain. Lack of expression of the hairless gene due to of the catalytic domain. Lack of expression of the hairless gene due to catalytic domain thair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have compensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The deoxy-ribozymes have compensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen chair removal products which function by inhibiting hairless protein mRNA immediately after nucleotide 1641.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
Sequence
                                         expression. The sequence presented is the devi-
human hairless protein mRNA immediately after
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention discloses a new catalytic DNA or RNA molecule that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    to catagen phase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsuitism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the CC hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting CC phase. A non-human transgenic mammal is useful as a model for testing CC phase. A non-human transgenic mammal is useful as a model for testing CC phase and products which function by inhibiting hairless protein CC hair removal products which function by inhibiting hairless protein CC hair removal products which function by inhibiting hairless protein CC hair removal products which function by inhibiting hairless protein mRNA immediately after nucleotide 1698.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Loc

                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have CC including ribozymes and DNAzymes. Ribozymes are RNA structure to the CC including ribozyme, called deoxy-ribozymes are RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the CC hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC degrade, in vivo, that hammerhead ribozymes or DNAzymes, calcid sare useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen CC phase. A non-human transgenic mammal is useful as a model for testing CC human hair fear more presented is the deoxy-ribozyme that cleaves the human hair each machined is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after minloride that cleaves the human intended is the deoxy-ribozyme that cleaves the human hairless protein manadiately after minloride.
                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                             a self-catalytic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAsymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting phase. A non-human transgenic mammal is useful as a model for testing phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1750.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsuitism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have

CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsuism, can be improved by inhibiting CC gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribzymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC degrade, in vivo, that hammerhead ribozymes or DNAzymes, having a CC degrade, in vivo, that hammerhead ribozymes The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen CC phase. A non-human transgenic mammal is useful as a model for testing CC phase. A non-human transgenic mammal is useful as a model for testing CC phase and products which function by inhibiting hairless protein cc expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1801.

catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the
                                                                                                                                                                                                                              specifically cleaves, or inhibits expression of, Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes, have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nair loss; atrichia; hair growth; hirsutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase: catagon where hair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
Best Local S
Matches 14
consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production
                                                                                                                                                                                                                                            The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protei which comprises a catalytic domain that cleaves mRNA at a define
                                                                                                                                                                                                                                                                                                                                                              Protein mRNA, useful for inhibiting cell, or for inhibiting transition
                                                                                                                                                                                                                                                                                                                                                                  New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-rib catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal product;

by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catager phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves human hairless protein mRNA immediately after nucleotide 2028.

The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at defined consensus sequence and binding domains contiguous with the 5 and 3 end of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsuitism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Catalytic DNA; catalytic RNA; hairless protein; ss; hair loss; atrichia; hair growth; hirsutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Deoxy-ribozyme, cleaving hairless protein mRNA after nucleotide 2033.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       25-FEB-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                             misc_feature

New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

/ a hair-producing from anagen phase

Christiano

A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC inherited mutations leads to the complete loss of hair, known as carrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient concluding ribozymes and DNAxymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding consisting the sequence specific RNA binding consisting the sequence specific arms. The deoxy-ribozymes consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The deoxy-ribozymes have consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen consensus products which function by inhibiting hair growth and for testing consensus products which function by inhibiting hairses protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 2047.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

New catalytic nucleic acid molecule that specifically cleaves Hairless protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                              to catagen phase
```

which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC inherited mutations leads to the complete loss of hair less gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have CC aself-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids CC are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen CC hair removal products which function by inhibiting hairless protein CC expression. The sequence presented is the deoxy-ribozyme that cleaves the CC human hairless protein mRNA immediately after nucleofide one The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protei which comprises a catalytic domain that cleaves mRNA at a define Sequence 29 human hairless protein mRNA immediately after BP; 9 A; 7 C; 9 G; 4 T; 0 other; nucleotide Protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC consensus sequence and binding domains contiquous with the 5' and 3' ends CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes are RNA structure to the catalytic core and two sequence specific arms. The deoxy-ribozymes have CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen CC the transition of a hair follicle from the anagen phase to the catagen CC hair removal products which function by inhibiting hairless protein CC human hairless protein mRNA immediately after nucleotide 2380.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The invention discloses a new catalytic DNA or RNA molecule that CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends CC inherited mutations leads to the complete loss of hair, known as CC inherited mutations leads to the complete loss of hair, known as CC including ribozymes in through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammarhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have catalytic core and two sequence specific arms. The deoxy-ribozymes have core lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen CC phase. A non-human transgenic mammal is useful as a model for testing CC hair removal products which function by inhibiting hairless protein CC human hairless protein mRNA immediately after nucleotide 2395.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New catalytic nucleic acid molecule that specifically cleaves Hairless protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC (BSCDNA) in eukaryotic cells. They use a DNA cassette that produces CC sscDNA in vivo. The cassette contains the Moloney murine leukemia virus Creverse transcriptase/RNase H, a bacterial restriction endonuclease CC gene, and a sequence of interest which produces a RNA template from CC which the reverse transcriptase synthesises cDNA of a specified sequence. CC The ssDNA is then modified to remove all flanking vector sequences by CC taking advantage of the stem-loop structure of the cDNA, which forms as CC a result of the inclusion of a inverted tandem repeat that allows the SscDNA to fold back on itself, forming a double stranded DNA stem, in CC the sequence of interest. The double-stranded stem contains one or more for delivery to a cell. The vectors are is useful for producing a ssDNA concleic acid molecule which is an antisense sequence or aptamer, an mRNA contains and target cell are useful for antisense sequence or aptamer, an mRNA contains and the teroduplex molecule. Inhibitory nucleic acid molecules to a target cell are useful for aleviating pathological conditions by regulating gene expression. The present oligonucleotide was used to concleic a vector for use in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                        ribozymes, tumour necrosis factor (TNF)alpha ribozyme, rat and human vascular epithelial growth factor (VEGF) ribozymes. These ribozymes can be used for treating or preventing a disease or condition responsive to an alteration in the expression of a gene, where the ribozyme is capable of cleaving the RNA transcribed from the gene. They can be used for treating or preventing a disease or condition associated with the proliferation of rapidly dividing cells, e.g. cancer such as malignant glioma. They can also be used for inhibiting the proliferation of cells. The use of 2'-amino modified pyrimidine can provide ribozymes of improved stability which retain the activity of the unmodified ribozyme. The
                                                                                                                                                                                                                                                                                                                                                                       The invention provides novel modified ribozymes that have 3 or more pyrimidine nucleotides (PMN) in the ribozyme modified at the 2'-position, where the PMNs are modified to 2'-amino PMNs and the ribozymes exhibit improved stability to RNAase degradation and exhibits 85% or more catalytic activity of the unmodified ribozymes. The ribozymes of the invention are selected from rat and human protein kinase C (PKC) alpha
